

A Report On

NEGATIVE SIDES OF ARTIFICIAL INTELLIGENCE

“

Good [morning/afternoon], everyone.

Today, our group presents on ‘**Negative Sides of Artificial Intelligence**’—
a critical topic that affects all of us.

While AI brings innovation, it also creates serious challenges:
job loss, discrimination, privacy invasion, and more.

Let’s explore these risks and understand why responsible
AI development matters.

INTRODUCTION

AI is everywhere—in your phone, banks, hospitals, and hiring decisions. But ask yourself: Is AI always good?

The answer is no. Today we'll discuss six major negative impacts:

1. **Job Displacement** - Millions losing employment
2. **Algorithmic Bias** - Unfair AI-driven decisions
3. **Privacy Invasion** - Data harvesting without consent
4. **Security Threats** - Autonomous weapons and cyberattacks
5. **Economic Inequality** - Wealth concentration in few hands
6. **Environmental Damage** - Hidden carbon footprint

These aren't theoretical—they're happening now. Understanding them is essential for responsible technology use.

MAIN DISCUSSION

1. JOB DISPLACEMENT - THE PROBLEM

Let's start with job displacement.

AI automation is eliminating millions of jobs worldwide.

Real-world examples:

- **Amazon warehouses:** robots replacing warehouse workers
- **Retail stores:** self-checkout eliminating cashiers
- **Manufacturing:** automated robots doing factory work
- **Customer service:** chatbots replacing call center employees
- **Transportation:** autonomous vehicles replacing truck drivers

The statistics: McKinsey Global Institute reports that 75-375 million workers may need to change jobs by 2030 due to AI and automation. But here's the critical issue: New jobs require different skills. A factory worker can't become a data scientist overnight. Without retraining programs and support, these workers face unemployment, poverty, and economic hardship.

2. JOB DISPLACEMENT - CONSEQUENCES

The consequences of job displacement are severe:

Economic impact:

- Rising unemployment rates
- Declining wages for remaining workers
- Widening wealth gap between rich and poor

Social impact:

- Mental health crises: depression and anxiety
- Family breakdowns: financial stress destroys relationships
- Community collapse: entire towns lose their economic base
- Increased crime: desperation leads to illegal activities

The harsh reality: Workers don't benefit from AI productivity gains.

Companies keep the profits. The burden of transition falls on workers themselves.

This creates a new underclass—people left behind by technology they had no control over.

3. ALGORITHMIC BIAS - WHY IT HAPPENS

Why does bias persist in AI?

Three main reasons:

1. **Biased Training Data:** Historical data reflects human prejudices. AI learns from this prejudiced data and replicates it.
2. **Lack of Diversity:** Most AI developers are from similar backgrounds. They don't recognize biases that affect others. Homogeneous teams create biased systems.
3. **Insufficient Testing:** Companies test AI for accuracy, not fairness. They measure 'does it work?' but not 'does it discriminate?'

The scale of harm:

- A human manager might discriminate against dozens of people
- An AI system affects millions simultaneously
- This discrimination is automated, invisible, and difficult to challenge

The result: Systemic discrimination becomes even more entrenched because it's hidden in complex algorithms that nobody understands.

4. PRIVACY INVASION - YOUR DATA IS STOLEN

Here's something you experience daily but might not realize: massive privacy invasion.

What data is being collected about you **RIGHT NOW**:

- Your location (even when 'off')
- Every search you make
- Every website you visit
- Your messages and emails
- Your health information
- Your financial details

DATA TABLE

Negative Impacts of AI — Global Concern Survey (2023)		
Category	Percentage (%)	Description
Worried about AI privacy invasion	72	Users concerned about data collection by AI systems
Concerned about job loss due to AI	67	Workers afraid of being replaced by automation
Concerned about AI in weapons/warfare	61	People worried about autonomous AI weapons
Encountered AI-generated misinformation	55	Users who faced deepfakes or AI fake news
Believe AI has racial or gender bias	49	People who think AI decisions are unfair or biased

Source: Global AI Impact & Public Concern Survey, 2023

DATA CHART

EXPLANATION OF THE CHART

The chart shows the major concerns people have about Artificial Intelligence (AI) according to the Global Concern Survey (2023).

- **Privacy Invasion (72%)** is the biggest concern, indicating that most people worry about how AI collects and uses personal data.
- **Job Loss (67%)** is the second highest concern, as many workers fear that automation may replace human jobs.
- **AI in Weapons/Warfare (61%)** is another significant issue, with people worried about autonomous weapons and military applications of AI.
- **AI-generated Misinformation (55%)** shows concern about deepfakes and fake news created by AI.
- **Bias and Discrimination (49%)** remains an important issue, as some people believe AI systems can make unfair decisions based on race or gender.

CONCLUSION

As we navigate the rapidly evolving landscape of the 21st century, Artificial Intelligence (AI) has undoubtedly emerged as one of the most powerful and transformative technologies in human history. Throughout this presentation, we have explored the profound capabilities of AI, but more importantly, we have critically examined its dark side—the social, ethical, and technical risks that accompany this technological revolution.

From widespread job displacement and automated unemployment to deep-seated algorithmic biases that reinforce social discrimination, the negative impacts of AI are no longer theoretical threats; they are challenges we face today. Furthermore, serious technical vulnerabilities, cybersecurity risks, privacy invasions, and the alarming spread of AI-generated misinformation (like deepfakes and fake news) pose a direct threat to the stability of our societies and the trust within our communities.

The core takeaway from our findings is that AI, at its foundation, lacks moral judgment, empathy, and consciousness. It is a reflection of the data it is trained on and the intentions of the humans who design it. Therefore, we cannot afford to let AI develop in a regulatory vacuum. To prevent its misuse and mitigate its risks, there is an urgent and undeniable need for strict global regulations, robust ethical guidelines, and democratic oversight.

Ultimately, the goal is not to reject or fear Artificial Intelligence, but to master it responsibly. Humans must always remain in ultimate control ("Human-in-the-loop"). By fostering awareness, demanding transparency from tech creators, and implementing proactive policies, we can minimize the negative sides of AI while safely harnessing its immense potential for the betterment of society.

TEAM MEMBERS CONTRIBUTION

MEMBER DETAILS	CONTRIBUTION DESCRIPTION
Shamim Ahmed ID: 2026000000277	Prepared the presentation slides from start to finish. Led the core topic understanding and explanation for the written report. Collaborated with the entire team to brainstorm and prepare relevant case studies, examples, and detailed diagrams.
Farzana Akter Meem ID: 2026000000320	Served as the primary author for the written report, managing its formal formatting, layout, and structural organization. Collaborated with all team members to draft content, integrate case examples, and design illustrative diagrams.
Mahbub Alam ID: 2026000000272	Collected critical survey data and online reference materials, analyzed data trends, and developed the comprehensive Excel spreadsheet. Contributed actively to writing the group report, formulating real-world examples, and creating diagrams.
Jesmin Akter Jhuma ID: 2026000000297	Created, configured, and maintained the project's GitHub repository for collaborative file access and version control. Actively participated in writing sections of the report, developing practical examples, and shaping project diagrams alongside the team.

USE OF AI TOOLS

AI Tools to Address AI Risks (For Your Presentation Slides)

Adding this section will make your presentation highly practical, showcasing existing tools used to detect and mitigate the negative sides of AI.

1. AI-GENERATED CONTENT & DEEPFAKE DETECTORS (TO FIGHT MISINFORMATION)

- **Deepware Scanner:** A powerful tool used to scan and detect whether a video is a deepfake or manipulated by AI.
- **Hive Moderation:** Used to detect AI-generated images, texts, or videos, helping platforms filter out harmful or fraudulent automated content.
- **GPTZero / Originality.ai:** Widely used in education and publishing to check if a text or assignment was completely generated by AI models like ChatGPT.

2. ETHICAL & RESPONSIBLE AI TOOLS (TO REDUCE BIAS & DISCRIMINATION)

- **IBM AI Fairness 360:** An open-source toolkit that helps developers examine, report, and mitigate algorithmic bias and unfairness in machine learning models.
- **Google What-If Tool:** An interactive visual interface designed to help users analyze how AI models make decisions and test them for fairness and algorithmic constraints.

3. PRIVACY & DATA PROTECTION TOOLS (TO AVOID PRIVACY INVASIONS)

- **Private AI:** Automatically detects, anonymizes, and masks Personally Identifiable Information (PII) before data is fed into AI systems, ensuring strict data privacy and compliance.
